1 備忘録

1.1 テンプレート

```
1  #include <iostream>
2  #include <algorithm>
3  #include <iomanip>
4  #include <map>
5  #include <set>
6  #include <queue>
7  #include <stack>
8  #include <numeric>
9  #include <bitset>
10 #include <cmath>
11
12 static const int MOD = 1000000007;
13 using ll = long long;
14 using u32 = uint32_t;
15 using namespace std;
16
17 template<class T> constexpr T INF = ::numeric_limits<T>::max()/32*15+208;
18
19 int main() {
20
21     return 0;
22 }
```

1.2 makev chmax chmin

```
1  template <class T, class U>
2  vector<T> make_v(U size, const T& init){ return vector<T>(static_cast<size_t>(size),
   →  init); }
3
4  template<class... Ts, class U>
5  auto make_v(U size, Ts... rest) { return
   →  vector<decltype(make_v(rest...))>(static_cast<size_t>(size), make_v(rest...)); }
6
7  template<class T> void chmin(T &a, const T &b){ a = (a < b ? a : b); }
8  template<class T> void chmax(T &a, const T &b){ a = (a > b ? a : b); }
```

1.3 ファイルを作成する

テンプレートを書いたら、bash を開いて、以下のコマンドを打つ。

```
1  for i in {A..H}; do cp main.cpp $i.cpp; done
```

1.4 構文解析

```
1  using state = string::const_iterator;
2
3  int num(state &cur);
4  int factor(state &cur);
5  int muldiv(state &cur);
6  int addsub(state &cur);
7  int expr(state &cur);
8
9  int factor(state &cur) {
10     if(isdigit(*cur)) return num(cur);
11     cur++;
12     int ans = addsub(cur);
13     cur++;
14     return ans;
15 }
16

43         }else if(*cur == '-'){
44             cur++;
45             ans -= muldiv(cur);
46         }else break;
47     }
48     return ans;
49 }
50
51 int expr(state &cur){
52     return addsub(cur);
53 }
```

2 使いそうなライブラリ

2.1 繰り返し二乗法

```
1 template <class T>
2 T pow_ (T x, T n, T M){
3     uint64_t u = 1, xx = x;
4     while (n > 0){
5         if (n&1) u = u * xx % M;
6         xx = xx * xx % M;
7         n >>= 1;
8     }
9     return static_cast<T>(u);
10 };
```

2.2 約数列挙

```
1 template<class T>
2 vector<T> divisor(T n){
3     vector<T> ret;
4     for(T i = 1; i * i <= n; i++) {
5         if(n % i == 0) {
6             ret.push_back(i);
7             if(i * i != n) ret.push_back(n / i);
8         }
9     }
10    sort(begin(ret), end(ret));
11    return(ret);
12 }
```

2.3 素数列挙・素因数分解

```
1 vector<int> get_prime(int n){
2     if(n <= 1) return vector<int>();
3     vector<bool> is_prime(n+1, true);
4     vector<int> prime;
5     is_prime[0] = is_prime[1] = 0;
6     for (int i = 2; i <= n; ++i) {
7         if(is_prime[i]) prime.emplace_back(i);
